

ABSTRACT

An apparatus for processing fluid products, in particular paints and the like, comprising a main structure (11) which
5 defines a housing space (15) having an access opening (16),
door means (17) which are coupled to the main structure
(11) and which can be selectively moved from a closed
position to an open position of at least part of the access
opening (16), and vice versa, and support means (20, 22,
10 50) for at least one container of fluid products to be
processed, which support means are housed in the main
structure (11) and can be moved from an operating
processing position to a position for loading/unloading the
at least one container. The door means (17) comprise
15 movement means (22, 17, 74) which mechanically interact
with the support means (22, 50) in order to move them from
the operating processing position to the loading/unloading
position as a result of selective opening of the door
means.
